Topic: Schizophrenia and the creation of a brain

00:00:00

Introduction from the various KSs on what they were up to over the last week.

27m Ludmil asked about possibility of soldering the copper layer to the inside of the reactor –

MK answers – Gans in nano layers is the diamond structure and you can't solder or weld it – (relates to the diamond structure of CNS going to softer carbon in the CNS in ALS and MS seen as darker blotches on MRI scan)

There are now 7 double-core reactors in the building and MK talked about setting it up as a solar system, with the Iranian reactor that had antigravity characteristics with nuclear material, now being used as the star in the solar system and testing the use of non radioactive substances.

We have the ability to replicate the whole solar system in the lab, in the next few weeks - they now know how Venus works going backwards etc

Iranian is a half moon combination – works well in a nuclear condition now going to non-nuclear condition. Going to try 4 or 5 gases to see how they perform.

Thinking 40 or 50 reactors brought by people all over the world in the next couple of years - do a months visit check out the structure of the galaxy !! Anyone who wants to see how the universe works bring your reactor in the next 6-12 months.

Copper oxide went to Tokyo with Yukako – for testing at Fukushima

These guys spent two weeks preparing all the copper in little tubs, but the motor would not run and the light did not come on and they all left the lab one by one with tail between their legs - but what looked like a failure just means they didn't understand the condition, and all they needed was patience and time. What was produced from that experiment is going to Tokyo with Yukako.

This demonstrated the production of fat and protein with a tiny little current and some copper and copper oxide electrodes – even started the production of blood when the use of iron connectors was used – red spots like blood cells

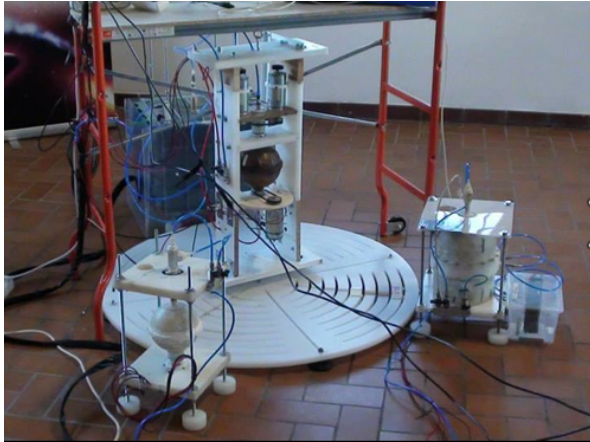

Starting the process of using the Gans to feed the corn and the wheat seeds – has been studying the timing of the soaking etc, and now the materials running will accelerate the process. Later talked about how the difference between soaking them 30secs or 1 hour made a huge difference in 3 months time.

45m Q: Are the reactors going to fly off the ground?

MK: We try to keep T120 formation in mind for flight – 3 reactors have to stay in that position for a flight condition – however the non nuclear is unknown territory – we had some weight reduction and energy production, but still have problems with maintaining vacuum – eg the Belgian reactor in which the guy turned the whole thing upside down 180 degrees and now a lot of problems...

T120 arrangement of reactors from facebook site

<https://www.facebook.com/SpaceshipInstitute>

47m Q: Is it going to levitate? –

MK: we don't levitate we produce positional magrav fields - the reactor that Marek and Armen are using has flown when used with the Iranian flight system, but now it is boxed – this one used to fly up and they had to catch it like a rugby ball, so now they tie them down in frames – the Iranian reactor could carry two people,

George's one is the devil we don't know the joker in the pack because it can fly off its centre then the next minute anticlockwise or decides to stop. As it changes it can effect the magrav fields of the other reactors – so this one wont fly but it will effect the operation of the others and the flight system – and we can learn lots from this. MK has worked with this one and he knows its character. He speaks of the reactor as a living entity ...

John's ceramic reactor they are putting it in a Faraday cage with holes so they can see it – the ceramic can fly to pieces needs to be in a protective mesh cage –

Lucien asking questions about the KS videos of their plates – MK explains that the two electrode pieces or plates can touch each other, (unlike with normal electrodes where if they touched the whole process would not work) nano coated diamond structure does not allow

## Transcript from 4<sup>th</sup> Knowledge Seekers Workshop held March 27, 2014

electron passage, only magrav. Some of them are 2 electrodes, copper and nano-coated copper – power producing cells are zinc and copper – the condition changes depending on the form and distance of the electrodes. – gives a different production – 3 different substances - 4 different electrodes – performance – step by step – the next step is 4 -6 electrodes.

The planet became an oxygen based planet when the CO2 saturations was converted to Gans and in the process Oxygen was released – also the planet gets warmer in this process

This workshop is aimed at learning about the structure of the brain. There are no tissues there are different densities as seen on MRI – the material – fat – formed by these experiments is the beginning of the creation of the brain, - made out of Gans materials –

One of his targets is one of the reactors will be full of Gans liquid – that will be the central brain – he is step by step expanding the knowledge – so this workshop is about schizophrenia this is one of things he has researched since 1981 – the structure of the brain and its relationship with schizophrenia

Schizophrenia – Man does not understand his own structure – and blames others like schizophrenics for the problems he has created with his misunderstanding – schizophrenics are two different souls in one brain – completely different tastes and interests – communicate with each other – often one is recognized by family but not the other one who then commits violence out of frustration and anger then the other twin commits suicide.

If you are a parent or a doctor we show you how to bring these ‘Beautiful twins’ into society and integrate them with each other – if the two characters souls are both recognized – usually come out at the 18 – 25 y o mark --- when you access the other twin and find their name, gain their trust – what’s the name of the other one? – when they introduce the other one to you – you gain their trust - you gain the knowledge of God

Schizophrenia is a specific twin condition and they are brilliant people – talking to themselves is one of the first signs. The first 4 or 5 years after puberty is the most confusing – the 2<sup>nd</sup> born is trying to exert his existence – I exist too! – and this becomes a huge problem they often laugh

at a joke between themselves – or control it and just grin – often stay in their room like lovers content with their own company.

MK is asking people to please transcribe these workshops and publish them – get this knowledge out – also offering if anyone has friends with schizophrenia to come on the live stream then people will see that these are geniuses that we have locked up for centuries.

We have to understand the process and the reason and not be so materialistic.

Vince asks a questions MK explains that the emotional part of the brain has a split into two characters, just like regular twins - but the physical part does not split – so you get the gorgeous beautiful twins – one day you can go out to a disco with a girl and the next day to rugby with a boy both in the same body

MK is asking people to get in touch with the ALS program if they need help with friends or family with schizophrenia No one- should be locked up with schizophrenia – the doctors should be locked up and the twins outside – goes on at length on how important it is to recognize and talk separately to the two beautiful twins –schizophrenia is a birth rite – not a disease, as many physical twins you see – as many schizophrenics there are out there – we need to educate the parents as much as the twins – and teach/educate the family – these are innocent people who have been caught and locked up due to misunderstanding

0152 Mr Chu: how did you discover this and how does it relate to the magrav fields?

MK: the twins create their own magrav fields – you can identify the different parts of the brain used by each twin w MRI scan.

156 Ludmil: ... a question from Eliya – how do the different Gans layers in the brain and neuro system relate to the neurotransmitters?

## Transcript from 4<sup>th</sup> Knowledge Seekers Workshop held March 27, 2014

(v1 2016-03-05) DRAFT (Transcription has not been verified. Double check info with video)

MK: each nerve has layering, centre each nerve is emotion, outside is physicality...in ALS the physicality is disabled – they loose speech first because cannot express the pain anymore – choose silence – it's the outside part of the nerve that looses structure

205 – Ludmil passing on Eliya's question - what do you mean nerve? Axon, glial cells etc –

MK: don't go too technical Eliya! You should be here!

Lucien – asking about what people do if they see nothing –

MK saying we are like people who want to put an egg and some flour together and expect it to be a cake – there is always something happening – leave it alone for a while – like the guy who discovered penicillin he had an argument with his wife so he went out for a while and discovered the answer (lol)

Lucien – persisting saying up front nothing is happening –

MK: - 'no no no no no no no!' – there is always some thing different – for example the systems in the 48 boxes are planned system but to the KS looks like chaos – but he knows how to do it and designed the experiment to produce energy and to produce fat, - explained how making the electrodes and their shape - which way they were turned up or down makes a vital difference – to the KS this was random but he knows in 2 or 3 cups you see the orange and bubbles which means CH<sub>3</sub> – these ones are the ones they need to study – they need to categorize everything – and learn in this way.

226 the effects of different ways and solutions of soaking seeds has a major effect 3 months down the line – same with the Gans production on the copper wires – same thing with applying the caustic – and you don't even have to take the plastic off the wires

Ludmil: – sorry but my plastic cover wires had no layers

## Transcript from 4<sup>th</sup> Knowledge Seekers Workshop held March 27, 2014

(v1 2016-03-05) DRAFT (Transcription has not been verified. Double check info with video)

MK: look at what you are doing – your nano coating is probably too thin – Joe posted a video – all his wires became white so the caustic dust was too close – for a nano layer to be visible it has to be 5- 10 -15 thousand layers – you're talking about nano – that's 10 to the minus 9 ---- can also check it with voltmeter or ohmmeter – but don't press and break the coating – the wire he uses for his system is not black – copper brown colour (very thin layer) – you might be able to produce pure hydrogen – the deeper thinner layers more simple, then get very thick – more heavy eg for use in Fukushima. Test the wires with ohmmeter - the very thin layers are for very light elements – therefore use your weakest LED – and if you see bubbles- → pure hydrogen ... I can see you crying foul game but you don't see you've got the gold in your hand – so its your problem!! (lol)

Vince – some of his wires look like they're not coated but he gets some voltage in the 2<sup>nd</sup> process

MK: – yes – but use the coating in the right way and you will see if you multiply in boxes what you can get out of it – look beyond the physicality, understand the process

Lucien: – can you use electro gels on the nano coating to measure the voltage ?–

MK doesn't know – asks him to try it and see if it works – let us know

MK: – In the next few days/weeks they will set up a brain structure reactor and it will be interesting – will show it next week and show the operation of the Gans system as a brain operation system control – if it works maybe we can show the real operation of the Gans layers not as a layer but as a collective – a decision maker – this will take some development but we are building a spherical reactor and see if we can transmit info across boundary without electrical current eg emotional input – can then show how the brain functions that will be very eye opening, with 8 of us around the lab the possibilities have become more frequent and interesting – next stage shows micro and macro together – the stuff in the pots and how this relates to the reactors – the whole thing goes back into the structure of schizophrenia – MK does another plea for people who want help with schizophrenic friends or family to get in touch

–

239 Question from Lucien about an intermittently functioning pod seen on the KS videos –

MK: the fatty layer can interfere with the absorption of CO<sub>2</sub> through the water to be turned into Gans layering – causing some disruption in the process .. if you don't generate fat would be easier

One of the easier ways to produce non copper oxide wires for the test is the coca cola bottle – you strip the wires and you put them in caustic. instead of the caustic you make two holes and put the head and tail of the wire into the bottle – put the caustic in shake it and leave the bottle for 2-3 days – then you have perfect non oxidized nano layers, the duration and compactness of the wire will dictate the thickness of the layers on the wires – this has been in public for 5-6 years on Keshe foundation video — make sure one end is not coated – and put it into the coca cola bottle hole, seal it, put caustic – you will have a spider coming from the bottle in a way – to connect one end to the bottle and connect the other end then you have progressive layers producing different materials depending on how far from the bottle – the further end creates lower layers and when you put it in caustic it gives a different spectrum of the magrav field and will absorb different things – this is shown in the patents – it can give you a nice homogenous non oxidised system.

Lucien: – the big patent – it appears different from coca cola bottle – shows a circular wire ? is this a ground electrode??

MK: these patents were written about 10 years ago – a lot of them were shown by Dirk's creative mind to make it visual - if you put different washers or knots or though a zinc ring you will find out your coating is totally different – the magrav field of the knot or the washer etc et is all different – These are for when we lot get more educated and look at the totality – the washer is not for ground it is to show that the electrode is different – too early for you to understand – even with Gans materials your wire has different layers, nano layers not created randomly – has to be a process – so you want a resistor then a capacitor by placing the right material up against it you dictate the coating composition along the wire – not through the wire – this is something for the future – in one piece of wire you have everything you need for a radio ... don't run before you walk – you are ignorant –

Lucien: – yes well this is why we are asking some questions!

MK: we are still having a lot of trouble in nano coating steel or stainless steel – there must be a way to nano release the surface of the steel –

Rick: – any final comments?

MK: not really – pretty much covered, but getting it in text would be good to put on the website – because he has no time to write more books –

Rick: – yes people working on that

MK: Our biggest problem will be from the FDA because they will have no need for drugs anymore – many of the ‘skeptics’ writing negative comments on the websites - when investigated they are all being paid by pharmaceutical companies in the background – hidden in the Swiss private accounts – The so called ‘skeptics group’ is just another name for blocking by pharmaceutical corporations – they are earning monthly payments coming to 30 -40G a year – these so called skeptics are wage paid criminals – MK threatens to open their identities and bank accounts in the courts of Belgium – Thank you very much!

Many expressions of thanks from everybody

Rick: And so ends the 4<sup>th</sup> Knowledge Seeker workshop direct from the Space Ship Institute and the knowledge seekers!
