Notes on KNOWLEDGE SEEKER Workshop 87 12 November 2015

This is the Knowledge Seeker workshop that followed the 18th Chinese workshop on Thursday the 12 November 2015

0000: MK discusses development of International Keshe foundation – Innovations Team with Renan in Phillipines – 30 to 50 Nations manufacturing – 51% ownership by Central Kf prevents what happened in China with Omega Quantum (profit making business in the old paradigm based on secrecy and competition rather than open source according to the ethos of the Kf.)

0020: We are on the verge of producing the power generator to add to the system. This can be used to augment power from 2KW to 5.4KW – this is enough power for the standard house in Africa for refrigeration and lighting and all needs (less than the Western world)

0022: We have to make sure of correct conduct in International Kf – tech must be used correctly

0024: There was a report on youtube that a CO2 kit was not working – this is a correct report – the kit is not working because the copper is plastic coated – this changes the magrav field so will not attract the carbon and precipitate CO2

0029: When you receive your Magrav box – please follow the instructions – there is a document included – please read carefully and follow the procedure..

0031: Make sure you don't put a meter after your stacker system – it will

block and cascade and overheat your unit...

0036: Guadalupe presentation – French west Indies – nicely wound cols..

0038: 2c per litre charged by Italian govt for disposal of caustic – so we are developing method of extracting the caustic and re-using (with later developments of nano coating with heating, and then attachment to a nano coated unit the caustic has been made unnecessary for ongoing manufacturing)

0041: Presentation from Ali in Vancouver Canada.

0051: Kf now developing a 50KW unit for industry – back u system for hospitals and lifts etc.

0054: Do not use hot glues or plastic tapes on your capacitors or stacker system – they will heat up and burn out – please remove them..

0105: Roald Boom discovers his first stacker system was wound backwards – he has discerned that you have to turn your drill anticlockwise – which makes a clockwise coil.

0108: MK responds that RB's unit has the same problem as Ali's – wrapped in plastic. When the sun's rays meet the matter state of the Earth they heat up – this is what creates heating – the same as these devices wrapped in plastic.

1110: As Renan says “don't mummify your coils or capacitors!”

0113: Even if you made your coils the wrong way hold on to them – they will have a different application

0142: Richard U'bique – says he has run up against a few mistakes that need correcting.

0150: Detailed instruction paper that comes with the stacker unit – written and read by Vivek:

0211: Remember the SSI is a space ship program so the energy system is only the first part – a necessary part but only the first step on building your craft - You will also see hovering cars very soon

0236: Peter and Andreas from Austria – excellent teaching on coiling copper wires and nano coating

0255: MK: Some of you may notice black spots on the ceiling of your house after you plug in your units – this is evidence of nano coating the house and environment around you – and a reminder that this is a space ship program...

0258: Sandor's video on stripping the copper wire

0300: Emilio from Taiwan – a way of stripping copper wire using a potato peeler and a drill.

0302: Report from Karl Lee in China re putting his fatboy reactor inside a pyramid. MK says he has to make sure the cores in the fatboy receive different levels of energy – a gradient – connect it before the unit or 3 before and 2 after to create a potential GM field difference so it starts sucking on the plasma – then it will fly

0307: Coils from USA, Croatia, Austria, Vancouver. MK points out a lot of women are nano-coating – they are the best economists in the world because they have to look after a family – they know this is good value.

0311: Austrian presentation, MK is called away

0318: Richard U'bique remaking capacitors – lots of discussion with Rick and Sandor while MK is absent.

0335: Discussion, heated at times, of winding direction – clockwise versus anticlockwise.

0338: Kel-el comment re righty tighty lefty loosey – counter clockwise coils are the ones that will probably produce lift – because righty tighty seems to go into the surface and left loosey – unscrewing one self from the surface,

therefore more likely to create lift

0339: Rick agrees – he reckons clockwise into the Earth, counter clockwise off the earth.. Don't throw away the lefty coils. Rick: MK said earlier today about mixing the types of coils – possibly use left configuration on the centre coils and around them clockwise coils etc – to provide counter rotating fields. Kel el adds that if you stand under the rockets launched from Cape Canavarel you see them start to turn counter clockwise – and lots of other animated discussion,...

0353: Rick disagrees with someone re the interpretation of clockwise vs anticlockwise.

0404: MK final word saying it doesn't matter which way you coil the wire as long as its in the same direction. Exhorts people not to argue but just experiment – test with different ways of coiling and gansing – don't copy – experiment and teach us! The strength of plasma is by creating composite fields – the turns left or right don't matter.
