Ocean Water GANS

[Tele Valencia](#)

This is part of the 95th Knowledge Seekers Workshop

Mr. Keshe: When you use a seawater, you, to you, you here in the past, in the other set, you had the plates, but in the seawater you have the same position, you have a mixture of all the elements on this planet. I've explained this before. You go from gold to copper to zinc to whatever you want, whatever you imagine is in the seawater.

And, in so many ways, when you add the caustic to it, you change every molecular atomic structure, due to where they are, and how they connect to each other. How they connect through the containment of the system, you put it in, dictates how you collect so much GANS at the bottom. Most of this carries CONH, so you have by chance, by coincidence, CO₂ in it, you have a gradient of GANS of water.

A lot of you don't realize in the water system that you produce from the seawater you produce huge amount of GANS of water, huge amount of GANS of hydrogen, but what you see at the bottom is a spectrum of GANSes, depending on what temperature you created when you added ~~the GANS into it~~, the caustic into it, because each one has a temperature effect. So, when you collected the GANS, you see it's a lot of GANS collected, majority of it has zinc in it, has a CO₂ in it, has a GANS of water in it, and the combination of the lot gives you the white colour, and you're happy you have it.

But the GANS you collect from seawater, at the bottom of your container, is extremely, extremely a mixture of everything on this planet. But in the future, you can use this mixture for most of the things you want to use. If you get a

GANS of seawater and produce it on your coils for a space technology, in the batteries, you have the full spectrum of the energies needed for space travel. It's as simple as that.

Most of you who created the GANSes with a seawater, you use the GANS for your batteries for your space technology, for feeding, everything is in there, whatever the man needs is in the ocean. OK? (cough) When you make your batteries, and when you use the GANS of the material on it, then now the energy of the GANS of whatever was in the sea now is available for the man.

You can use every element you can imagine in this system. If you use water from different parts of the ocean, you'll receive different types of GANSes, but near enough in the strength in certain elements. In time when you test you'll understand more. If you give the, this GANS to be tested by Raman spectroscopy, and infrared spectroscopy, and other spectroscopies, you'll find they give every element, which is within the creation of this planet. But majority of it is CO₂, and the zinc, which is part of the structure, because again carbon is 12 and zinc is 16, the (spider?) factor.

That's why human race, the body (inner?) structure of life on this planet, is very much dependent on the operation of the zinc, because in part of the structure of the amino acid, zinc behaves very much as a stronger carbon, and in that conjunction it allows different structures to come into operation. Life is not accidental on this planet, it's orderly, and it has sent for one to support the other, replacement of one thing to the other. That's why in your body you have parotid glands, because the parotid glands changes this to this, or in another confirmation, and conversion, this to this, or to this, as it needs it.
