Self Sufficient MAGRAV System

[Tele Valencia](#)

Published on 12 Jan 2016

This is part of the 95th Knowledge Seekers Workshop

Mr. Keshe: So, what happened is that you had the power supply, you had the meter, you connected it to your Magrav Unit, you connected it to the power supply, to whatever load you wanted, you got one-third off on this side. Now, if you put a small load here, and another load here, and you create enough in time, what you call the plasma condition, and take one of the appliances, which you have here, or single appliance you specially put in that point, and connect it to a battery, or to AC inverter. Now you can supply the whole house directly from this unit, and because it doesn't go on the main line, your total power supply consumption is zero, on your meter. So, the system becomes self sufficient.

I repeat it that you understand what you've got to do to achieve zero power. This is your meter from the house, you have a point to your Magrav Unit, you connected your Magrav Units to some sort of appliances. This appliance here, you can feed from it, not to go through it, but connect to it, to a battery, or you can go to a AC inverter. We show you how to do the AC inverter, Alekz can tell you all you need to do is, to connect one line to the earth side of the wire, we show you how to do this later on. And then anything you take from here, which can be literally connected in the back of here, is totally free in the house.

So, you bring your Magrav Unit immediately before, to encourage the plasma flow, you put your load on this end, and you connect all the attachments to it. But this needs time, this needs a another few weeks, that you can nano coat the whole

structure. Don't forget Alekz in this (vision?) because he's now already working nearly 6, 8 months using the system. So, in the coming time, we'll give you a unit, we'll advise you, or you can build it as you do everything yourselves, that you create a new power generator from the system on the back of the unit, which gives you the free energy, and it is more or less wireless.

So, so, the system (ill???) and will become 100% powerful, power free, because here you convert immediately back into a system of a plasma, if you remember when we showed it in the Ambassador Meeting, and in the teachings in the, what you call it, couple of weeks ago in the Centre, we put 110, and 220 the drill, and the heater next to each other from the same source. You just need to be patient, the system is absolutely and become, more or less, free power Magrav system, but you have to allow the environment to build up, and with a simple single system it takes time.

We saw the lady who we showed first, she says she's running her studio free from any power to be taken from outside. In time, the environment changes to the appliances, and the system will go. You can in time de-plug, or literally disconnect from the main, and use the same plugs as you have in the house, but they'll all be free energy with a way, which the plasma, once it is set up and created, you can disconnect from this in time. Because the system will start feeding itself, absorbing energy from it's environment. This, this is just needs time for the system to set in.

So, the next step, once you've got your systems in time, is to keep on checking if, for example, your washing machine, or one of the appliances near to the system, is become plasmatic, and then use it to drain energy into a power supply, or inverter, of what we show you. And then if you create a plasma batteries, you don't even need that, then the supply becomes self condition, we disconnect from the main in time to come.
